## DETAILED ACTION

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 1/12/2004 has been entered.

Claims 1-8, and 11-57 are pending.

### ***Double Patenting***

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

3. Claims 1-8 and 11-57 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-63 of U.S.

Patent No. 6,415,791 in view of Newman (U.S. 4,424,806). Although the claims are not identical, '791 discloses the method steps including applying an oscillating compressive force to the chest of a patient, the oscillating compressive force having a steady state force component and an oscillating force component, supplying air pressure to a mouthpiece in communication with the mouth of a patient, the air pressure having an oscillating air pressure component and a steady state air pressure component inherently greater than atmospheric pressure, the steady state air pressure having a direction and magnitude tending to counteract the steady state force component of the oscillating compressive force (claim 23, inherently to counteract a force, the counteracting force would need sufficient magnitude and opposite direction). '791 recites the claimed method steps but fails to teach supplying the oscillating air pressure to an inflatable bladder in contact with a chest. Newman teaches that it is desirable in treating ventilation and circulatory problems to use an inflatable bladder to fill with pressurized air thereby creating compressions on user's chest. Therefore it would have been obvious to one having ordinary skill in the art at the time of invention to provide the device of '791 with an inflatable bladder as taught by Newman in order to aid in providing chest compressions. Subsequent limitations regarding the structure of mouthpiece and relative values of forces are disclosed in claims 14, and 16-19. Further limitations regarding relative values not explicitly disclosed are considered obvious modifications of the claimed method of '791.

**Conclusion**

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
